NICE NG1: Flow Chart for managing GASTRO-OESOPHAGEAL REFLUX (GOR) and GORD

Reassure:

- GOR very common
- Usually begins before 8 weeks
- May be frequent
- Usually becomes less frequent with time
- Does not usually need further investigation or treatment

Infant Gaviscon :

*1 dual sachet = 2 doses

If < 4.5kg, 1 dose If > 4.5kg, 2 doses

- Prescribe with directions in terms of 'dose' to avoid errors
- Maximum 6 doses a day
- Omit if fever or diarrhoea

PPi /H₂RA can be initiated in primary care if alginate therapy is not working but it is best reserved if overt regurgitation AND Unexplained feeding difficulties or distressed behaviour or faltering growth

1 Review feeding history, making up of formula, positioning...

2 Reduce feed volumes if excessive for infant's weight (>150mls/kg/day)

3 Offer trial of smaller, more frequent feeds (6-7 feeds/24hrs is the norm)

4 Advise parent to purchase pre-thickened formula (need large hole/fast flow teat):

Cow&Gate Anti-reflux, HiPP Organic Anti-reflux, Aptamil Anti-reflux (carob bean gum)

Or thickening agent to add to usual formula: Instant Carobel®

Or thickening formula (made up with cool

water): SMA Pro Anti-reflux (potato starch)

Or Enfamil AR® (rice starch)

If not successful after 2 weeks

→ If using, STOP pre-thickened / thickening formulae or thickener

2 weeks trial of Infant Gaviscon

Bottle fed: 1-2 doses* into 115mls (4oz) of feed

Breastfed: 1-2 doses* mixed up into a liquid (with cooled boiled water or

expressed breastmilk) and given with a spoon

If successful after 2 weeks

Try stopping it at regular interval for recovery assessment as GOR usually resolves spontaneously

If **not** successful after 2 weeks

Consider CMPA and/or Refer to Paediatrician for further investigation if GORD or alternative diagnosis suspected

GOR and GORD additional notes

Full NICE guidance: www.nice.org.uk/guidance/ng1

Background

- Passive regurgitation of stomach contents into the oesophagus is a <u>normal</u> finding in infancy. Most is swallowed back into the stomach but occasionally it appears in the mouth or comes out as non forceful regurgitation. At least 40% of infants will have symptoms of reflux at some time.
- Reflux will often improve by 6-8 months but it is not unusual for an otherwise well child to continue to have intermittent effortless regurgitation up to 18 months.
- Parents/carers should seek urgent medical attention if :
 - regurgitation becomes persistently projectile
 - There is bile-stained (green or yellow-green) or blood in vomit
 - There are new concerns (marked distressed, feeding difficulties, faltering growth)
- Possible complications of GOR are:
 - Reflux oesophagitis
 - Recurrent aspiration pneumonia
 - Frequent otitis media

GORD (Gastro-Oesophageal Reflux Disease) is a diagnosis reserved for those infants who present with significant symptoms and/or faltering growth.

- Prematurity, neurodisability, family history of heartburn, hiatus hernia, congenital oesophageal atresia are associated with an increased prevalence of GORD.
- Forceful vomiting should not be ascribed to reflux without closer review of the child's symptoms. Bilious (green) vomiting is always pathological and warrant urgent same day medical attention.
- GORD can sometimes be a sign of CMPA. The presence of atopic dermatitis, a family history of allergy / atopy and additional gastrointestinal symptoms should prompt consideration of a cow's milk protein allergy. CMPA can occur in breastfed infants (see <u>CMPA</u> section).
- Consider UTI especially if faltering growth or late onset, or frequent regurgitation + marked distress.
- Do not routinely treat or investigate for GORD in infant with or without overt regurgitation if they
 only exhibit one of the following: distressed behaviour / unexplained feeding difficulties / faltering
 growth / chronic cough / hoarseness / single episode of pneumonia.

Onward referrals

Referrals	Indications
Same day to Secondary Care	Worsening or forceful vomiting in infant <2months Unexplained bile-stained vomiting
	Haematemesis or Malaena or Dysphagia
Secondary Care	No improvement in regurgitation >1year old
	Persistent faltering growth secondary to regurgitation, Feeding aversion + regurgitation,
	Suspected recurrent aspiration pneumonia, Frequent otitis media, Suspected Sandifer's syndrome
	Unexplained apnoea, Unexplained non-epileptic seizure-like events, Unexplained upper
	airway inflammation
	If thought necessary to ensure acid suppression

Management of GORD

- Sleeping infants should be placed on their back but bed can be raised at an angle.
- Starch-based thickeners (Thick&Easy*, Nutilis*, Resource thicken up*...) are not suitable for children under 1 year (unless faltering growth/recommended by Paediatric specialist).
- Pro-motility agents such as domperidone should not be initiated in primary care. There is no
 evidence of benefit when treating infantile GOR. They can cause paradoxical vomiting and have
 been associated with a risk of cardiac side effects.

Products available

Instant thickener Not to be used with thickening formula or Infant Gavis			
Carobel Instant - Add to specialised formula (or expressed	From birth	Contains carob seed flour	
breastmilk) if anti-reflux formula not practical or possible	£2.91 per 135g	May cause loose stools	
OTC pre-thickened formulae Not to be used with thickener or Infant Gaviscon®			
Cow & Gate [®] Anti-reflux (Danone)	Birth to 1 year		
Aptamil [®] Anti-reflux (Danone)	Birth to 1 year	Contains carob gum	
HiPP Organic Anti-reflux (HiPP)	Birth to 1 year		
OTC thickening formulae Not to be used with thickener or Infant Gaviscon® or PPIs/H2 antagonists			
SMA Pro Anti-reflux [®] (SMA)	Birth to 18 months	Contains potato starch	
Enfamil AR® (Mead Johnson)	Birth to 18 months	Contains rice starch	

- Over the counter thickeners / thickened formulae contain carob gum. This produces a thickened formula and will require the use of a large hole (fast-flow) teat.
- Thickening formulae react with stomach acids, thickening in the stomach rather than the bottle so there is no need to use a large hole (fast-flow) teat. However thickening formula need to be prepared with cooled pre-boiled water, which is against recommendation of using boiled water cooled to 70°C. There is therefore an increased risk of bacteria being present in the milk. This risk should be assessed by a medical practitioner.
- Thickening formulae should not be used in conjunction with separate thickeners or with medication such as antacids (e.g. Infant Gaviscon[®]), H₂ antagonists (e.g. Ranitidine), or with proton pump inhibitors (e.g. Omeprazole).

Gaviscon

May cause a change in the baby's stool, and commonly constipation.
